                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a human proliferation and apoptosis related protein (PROAP). The polypeptides and polynucleotides can be used for the diagnosis, treatment and prevention of cell proliferative, immunological and reproductive disorders. Disorders associated with decreased expression or activity of include arteriosclerosis, cirrhosis, hepatitis, psoriasis, melanoma, lymphoma and cancers of the breast, brain and prostate, acquired immune deficiency syndrome (AIDS), allergies, anaemla, asthma, diabetes mellitus, osteoarthritis, andergies, uterine fibroids and disruptions of the mensitual cycle. Antibodies against PROAP can be use in diagnosis of disorders characterized by PROAP e.g. in ELISA (enzyme linked immunosorbent systs) and the polynucleotides may be used to detect and quantify gene expression in biopsied tissues. These techniques can also be used to monitor regulation of PROAP levels during therapeutic intervention.
                                                                                                                                                                                                                                                                                                                                                                                                             ;

The present invention describes primer sets for synthesising 5602

[ull-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligonucleotide complementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
coligonucleotide comprises at least 15 nucleotides; or (b) a combination
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence. Where the
oligonucleotide which comprises a 3'-end sequence, where the
oligonucleotide which comprises as 1'-end sequence, where the
oligonucleotide of sequence and sequence, where the
coligonucleotide of sequence as selected from those defined in
the specification. The primer sets can be used in antisense therapy. The primers are useful for synthesising polynucleotides,
contaction and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers also useful for the
contaction and/or diagnosis of the abnormality of the full-length
cDNAs easily without any specialised methods. AAH03658 and

                                                                                                                                                                                                                                                                                                                                                                                   Qγ
  The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit its homologues) that, when expressed in Triticum Aestivum, inhibit contents of growth of the plant. This growth inhibition is antagonised by growth of the plant. The products can be used to provide Rht expression in glaber-ellin. The products can be by treatment with gibber-ellin. In addition, the products can be by treatment with gibber-ellin in addition, the products can be by the dwarfing being gibber-ellin-insensitive. Taller plants will may be made by knocking out Rht or the relevant homologous gene in may be made by knocking out Rht or the relevant homologous gene in compounds which inhibit gibber-ellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibber-ellin biosynthesis inhibitor to keep weeds warf but let crop plants grow tall. The present sequence is encoded by the wheat Rht clone Sal genomic sequence.
                                                                                                                                                                                                                                                                                                                      ;

The E2A gene (see AAQ13669), encoding immunoglobulin enhancer-binding cfactors E12 and E47 (see AAQ13670 and AAQ13671), is localised to the breakpoint of a consistently recurring chromosomal translocation composed in many acute leukemias and is structurally altered by most present in many acute leukemias and is structurally altered by most cf.[1,19] chromosomal translocations. The translocation results in the breakpoint between chromosome I and 19.

CC the breakpoint between chromosome I and 19.

CC the complete nucleotide sequences of the SUP-B27 fusion cDNAs were composed and represented in a composite sequence (see AAQ13672).

CC clone KJ9 differs from the other four fusion cDNAs in that it has a small deletion of chromosome I-derived DNA. The KJ9 variant cencodes a predicted 80 KD protein.

CC although the predicted fusion proteins contd. the amino two-thirds of concodes a predicted fusion proteins contd. the amino two-thirds of climerisation motif, which was replaced by a polypeptide encoded by conclaps, with a region in homeoproteins that correspond to their correspond to their

breakpoint of a consistently recurring chromosomal translocation present in many acute leukemias and is structurally altered by most (1.19) chromosomal translocation. The translocation sensits in synthesis of a fusion mRNA (see AAQ13672 for fusion cDNA) that crosses the breakpoint between chromosome 1 and 19.

The complete nucleotide sequences of the SUP-B27 fusion cDNAs were determined and represented in a composite sequence (AAQ1372). The fusion cDNAs encode a 85 kD protein. Clone KJ9 differs from the other four fusion cDNAs encode a 85 kD protein. Clone KJ9 differs from the complete mucleotide sequence (AAQ13672).

Although the predicted fusion proteins contd. the amino two-thirds of EZA, they no longer retained the helix-loop-helix DNA-binding and dimerisation motif, which was replaced by a polypeptide encoded by coverlaps with a region in homeoproteins that correspond to their
factors E12 and E47 (see AAQ13670 and AAQ13671), is localised to the

The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 3'0 different tissues. EST sequences usually correspond mainly to the 3' contranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in 10 those cases where longer CDNA sequences have been obtained, the full 5' CTC UTR is rarely included. 5' ESTS are derived from mRNAs with intext 5' CTC UTR is rarely included. 5' ESTS are derived from mRNAs and genomic ends and can therefore be used to obtain full length cDNAs and genomic CNAS. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream crequences and to design expression and secretion vectors.
                                                                                                                                                                                           ö

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antegonised by a globerellin. The products can be used to provide Rht expression in glibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants wild-type, the dwarfing being gibberellin-insensitive. Taller plants to the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, compounds which inhibit grow tall. The present sequence is encoded by rice expressed sequence tag (EST) AAD39460, which is homologous to the wheat Rht gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 6, Application US/08470837

Patent No. 5800811

GENERAL INFORMATION:
APPLICANT: Nimni, Marcel E.
APPLICANT: Hall, Frederick L.
APPLICANT: Tuan, Tai-Lan
APPLICANT: Groundy, David T.
TITLE OF INVENTION: Transforming Growth Factor B Fusion
TITLE OF INVENTION: Their Use in Wound Healing
NUMBER OF SEQUENCES: 34

CORRESPONDENCE ADDRESS:
ADDRESSEE: Merchant & Gould
STREET: 11150 Santa Monica Boulevard, Suite 400

AND PRODUCES A SPIKE BROADENING OF THE IDENTIFIED HEART EXCITATORY
NEURON (PON); ALSO ENHANCES THE AMPLITUDE AND FREQUENCY OF THE
HEART BEAT. HAS ALSO AN EFFECT ON SEVERAL OTHER MUSCLES.

INDOCATEMENTS: THESE PEPTIDES ARE RELEASED FROM MAST CELLS IN LUNG (AND OTHER TISSUES) DURING HYPERSENSITIVITY REACTIONS

(ANAPHYLAXIS). THEIR ACTIVITIES, PREFERENTIALLY AFFECTING EDSINOPHILS, INCLUDE CHEMOTAXIS, CHEMOTACTIC DEACTIVATION, RELEASE OF ENTINES, AND STIMULATION OF THE HEXOSE MONOPHOSPHATE SHUNT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                               "purification and synthesis of eosinophilotactic tetrapeptides of human lung tissue: identification as eosinophil chemotactic factor of anaphylaxis.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

BIOL. Chem. 261:16704-16713(1986).

-!- FUNCTION: EXHIBITS UNUSUAL SHARK REPELLENT AND SURFACTANT PROPERTIES. FORMS VOLTAGE-DEPENDENT, ION-PERMEABLE CHANNELS IN MEMBRANES. AT HIGH CONCENTRATION CAUSES CELL MEMBRANE LYSIS.

-!- SUBBUXIT: MONOMER. IN AQUEDOUS SOLUTION EXISTS AS A TETRAMER.

-!- SUBCELLULAR LOCATION: SECRETED.

-!- SIMILARITY: BELONGS TO THE PARDAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -!- PATHWAY: PLAYS AN IMPORTANT ROLE IN SEVERAL METABOLIC PATHWAYS.

                             This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonuclectides, ribozymes, antitumour agents, antivitals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab heamocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungl, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium moniforme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

Sequences AAY69610-Y69611 and AAY69617 represent tachyplesin analogues used in an exemplification of the present invention, in which the native tachyplesin cysteine residues are replaced with Ala. Leu and Asp. respectively: Tachyplesin (AAY69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y696912-AAY69614, AAY69616) in which the cysteine residues at positions 3, 7, 12 and 16 of the native the cysteine residues at positions 3, 7, 12 and 16 of the native the cysteine residues at positions 3, 7, 12 and 16 of the native the cysteine residues at positions. Josephie being unable to form intramolecular disulphide bonds, the analogues are functional as intramolecular disulphide bonds, the analogues are useful for antimicrobial agents. The tachyplesin analogues are useful for controlling fungal and viral activity in agricultural and medical controlling plant viruses. They can also be expressed in transgenic plants, preferably wheat, sordhum, sunflower, soya or especially maize plants, preferably wheat, sordhum, sunflower, and viruses. Note: The provide resistance to pathogenic fungil and viruses. Note: The provide resistance to pathogenic fungil and viruses. Note: The provide resistance to pathogenic plants to provide resistance to pathogenic plants to provide resistance to pathogenic plants of specification, but is derived from the generic tachyplesin analogue
                                                                                               ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungl, in particular for fungl pathogenic to plants e.g. Fusarium graminearum, Essarium moniforme, Sclerothina sclerotiorum, Sclerothina trifolorum and Aspergilus flavus. The peptides can also be used for treating and preventing infection in humans and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections
                                                                                                                                                                                      Tachyplesin; inhibitor; antimicrobial; plant pathogen; fungi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The new derivatives are used to deliver active sents on organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic mechanism, so can deliver active agents to cytoplasm and nor-live active agents to cytoplasm and nucleus,

                                                                                                                                                                                                                                                                                                         δŏ
                                                                                                                                                                                                                                      g
and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                     This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active apents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells

The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungl, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium moniforme, Sclerotinia sclerotiorum, Sclerotinia articolorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and
The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, particularly produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peptide derivs. of tachyplesin - having antimicrobial activity, against plant pathogenic fungi or human or animal infections

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                  AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fund, in particular for fund; pathogenic to plants e.g. Fusarium graminearum, Fusarium monificarme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

This sequence represents a generic tachyplesin (TP) analogue which has antimicrobial activity. Tachyplesin (AAK09608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y696912-AAK09614, AAK09616) in which the residues at positions 3, 7, 12 and 16 of the native tachyplesin are replaced by the hydrophobic amino acids isoleucine, value, methionine, phenylalanine or tyrosine, the same amino acid being present at all four positions. Despite being unable to form intramolecular disulphide bonds, the analogues are functional as antimicrobial agents. The tachyplesin analogues are useful for controlling fungal and viral activity in agricultural and medical applications and for controlling plant viruses. They can also be expressed in transgenic plants, preferably wheat, sorghum, sunflower, soya or especially maize plants to provide resistance to pathogenic fungi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for Killing and inhibiting fungl, in particular for fungl pathogenic to plants e.g. Fusarium graminearum, Fusarium monilforme, Sclerotinia sclerotiorum, sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin
                                                                                                                             New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tachyplesin; inhibitor; antimicrobial; plant pathogen; fungi;

                                                                                                                                                                                                                                                                                                                                                                                                                          AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungl, in particular for fungi pathogenic to plants e.g. Fusarium maniforeme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, tibozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic mechanism, so can deliver active agents to cytoplasm and nor-liver active agents, including crossing the blood-brain barrier.
                                                                                                                                                                                   ő
                                                                                                                                                                                                                                                                                                                                                                                                        Linear; tachyplesin; peptide antibiotic; beta-sheet; secondary structure; disulphide bridge; antibody; ribozyme; antitumour agent; antiviral; anti-inflammatory; mammal; cell membrane; passive transport; cytoplasm;
            haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monilforme, Sclerotinia sclerotiorum, Sclerotinia sclerotiorum, also be used for treating and preventing infection in humans and
                                                                                                                                                                                   Gaps
 (AAR75805) a small peptide isolated from japanese horseshoe crab

                                                                                                                                                                                                             The lipopolysaccharide-binding polypeptides may be prepd. by either solid-phase peptide synthesis followed by oxidn. to form the disulphide bridges or, subjecting horseshoe crab haemocytes to hypotonic extraction, extracting the residue with acid, and purifying the extract. The polypeptides have high affinity for lipopolysaccharide (LPS) endotoxins and are useful for removing such toxins from fluids, as antibacterial agents, eg active against Salmonella spp. and S. aureus, and for treating LPS-mediated immune and inflammatory disorders, eg superior trachebonochial infections, urinary tract infections, bedsores, burns, colitis, cirrhosis, hepatic insufficiency and post-operative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Sequence 9, Application US/08168809
Patent No. 5580852
GENERAL INFORMATION:
APPLICANT: Putnam, Rebecca J.
APPLICANT: Rao, Aragula G.
TITLE OF INVENTION: DERIVATIVES OF TACHYPLESIN HAVING
TITLE OF INVENTION: INHIBITORY ACTIVITY TOWARDS PLANT PATHOGENIC FUNCI
NUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:
ADDRESSE: Pioneer H.-Bred International
STREET: 700 Capital Square, 400 Locust Stree
